Regional Profiles of Model-Predicted Human Values Within Institutional Self-Assertion Contexts

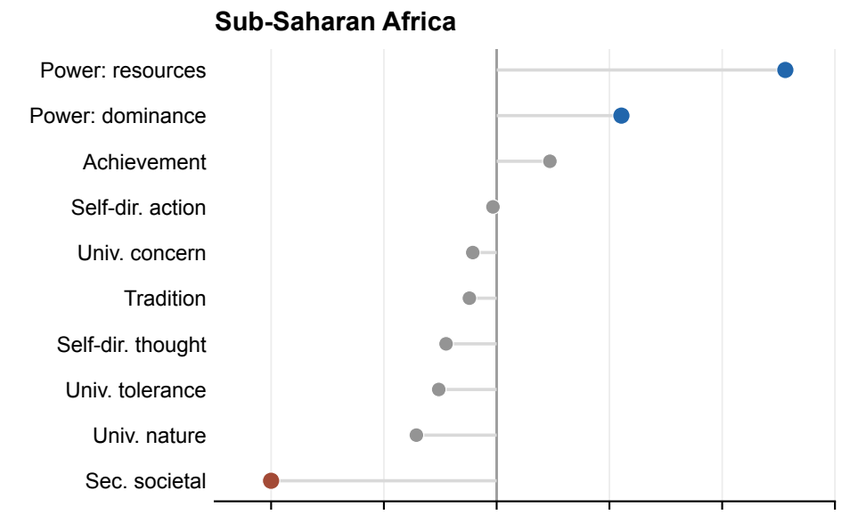

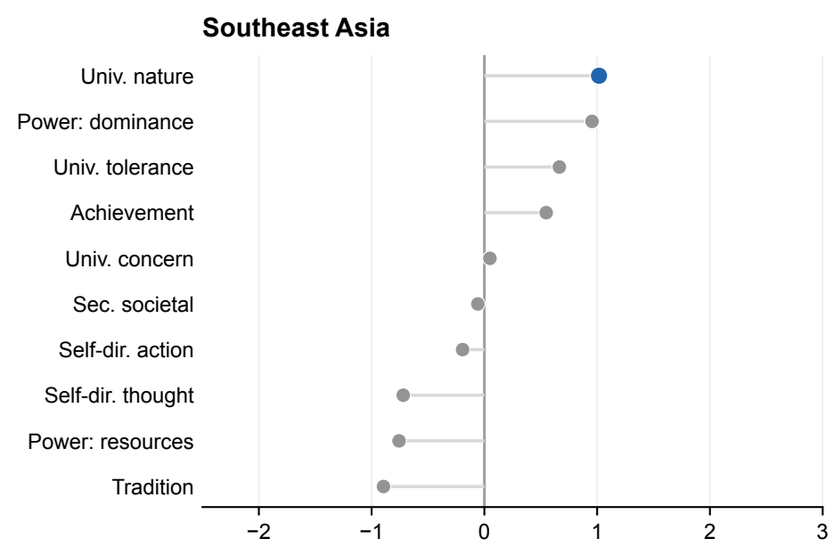

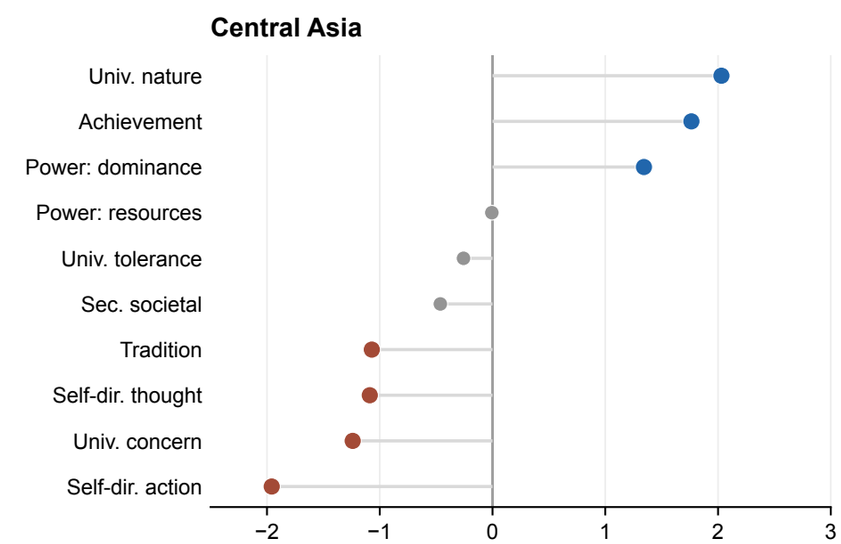

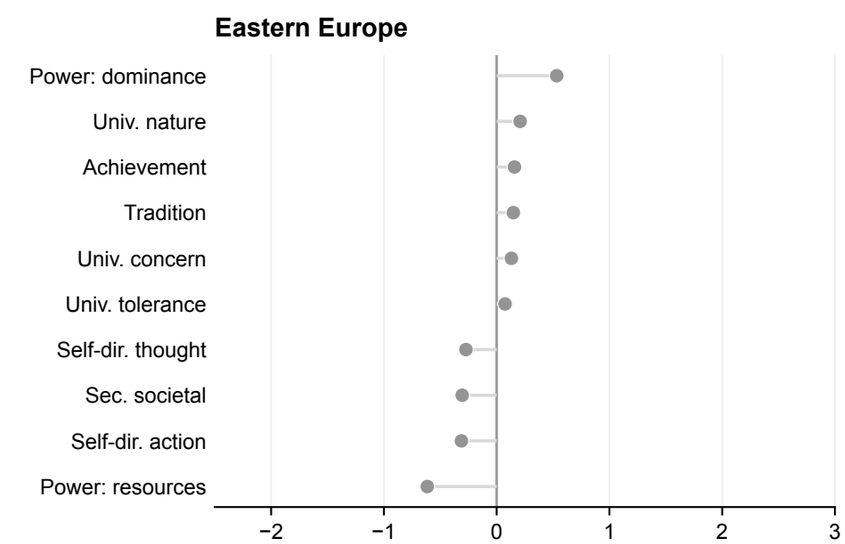

Relative standing within each value (z-score across nine regional case pairs)

Note. Each panel represents a two-country regional case pair. Scores are standardized separately within each value category across nine pairs (0 = cross-region mean; 1 = one cross-region SD). Values are ordered within each panel by standardized score. Only the ten categories with exploratory regional range ≥ 0.10 are shown. Blue indicates z ≥ 1; red indicates z ≤ −1.
